

Project Goals	Project Milestones
1. Use a Gwas-eQTL colocalization pipeline for immune-specific cell types 2. Compute aggregated scores for immune cell types for a Gwas locus 3. Rank immune cell types for a Gwas locus by colocalization scores	1. Create and set up github repository (with design documents of package) 2. Subset data into a smaller file for package development 3. Implement module 1: Load and validation gwas and eQTL files 4. Implement module 2: Run gwas - eQTL colocalization pipeline 5. Implement Module 3: Computing colocalization scores for each immune cell type for a Gwas locus 6. Implement Module 4 : Ranking immune cell scores by colocalization scores 7. Test functions and check for edge cases 8. Create tutorials for users to follow 9. Test package on original large files
